Callbooker 1.20 - quick reference

Contest callbook window for N1MM Logger+ / DXLog.net / VHFCtest4WIN | S55OO

What the colours mean

GREEN	three sources agree (QRZ + QRZCQ + HamQTH) - shown once, large
YELLOW	two of the sources agree - all values stay visible so you can pick
WHITE	all sources differ (or only one answered) - check it yourself

Reading the display

HF view	Name STATE/ZONE per source, e.g. Fred MA/5 MA/5 MA/5 (< 30 MHz)
VHF view	Name - locator per source, e.g. Fred - JN76GB - JN76GB (>= 30 MHz or VHFCtest4WIN)
Footer	call + where it came from: local (cache) / LAN (a peer) / online (fresh fetch)
... or .	slot still loading / that source returned nothing

Mouse

Right-click	menu: choose Name / CQ zone / State / Locator (any mix, at least one), Automatic (default), Contest start..., Clear contest start, Check for update now
Check update	title row link: asks GitHub now, downloads, then 'Restart to install'
? icon	help / releases page (also installs an update when update_auto=no)

Contest start countdown

Set	right-click > Contest start... type local YYYY-MM-DD HH:MM (blank = off)
Or in cfg	contest_start=2026-11-14 17:30 (the menu setting wins over the cfg)
Shows	READY (-3 s, red) STEADY (-2 s, yellow) GO (-1 s, green, held to +1 s)

Ports (UDP)

12060	N1MM Logger+ / DXLog.net lookup broadcast (127.0.0.1:12060 works)
6767	VHFCtest4WIN entry-field broadcast; if it already holds 6767 the app asks for admin once
6768	LAN cache sharing between Callbookers (allow it in the firewall; lan_share=no to turn off)
N1MM	in the Broadcast Data settings send the Lookup data to 127.0.0.1:12060
VHFCtest4WIN	Broadcast must be enabled or nothing arrives before logging

Callbooker.cfg (next to the exe, optional)

udp_port=12060	N1MM / DXLog.net port
qrz_username / qrz_password	paid QRZ XML API; without them QRZ uses the public page
update_check / update_auto	yes/no - GitHub check every 6 h, auto-download
vhfctest_share / lan_share	yes/no - 6767 feed, LAN sharing
cache_days=3	freshness of cached calls (max 3)

Update, step by step

1. Click Check update. 2. Wait for 'Restart to install'. 3. Click it.

The old exe stays next to the new one as Callbooker_<old version>.exe (fallback).

Never commit or share Callbooker.cfg - it holds your QRZ password in plain text.
